City of Marysville 2009 Water Comprehensive Plan Technical Memorandum

FINAL

Date: July 30, 2008

Subject: Planning Data and Draft Demand Forecast

To: David Zull, City of Marysville

From: Kelly O'Rourke, HDR

cc: Andrew Graham, HDR

Project No.: 61281

This technical memorandum (tech memo) serves as the first deliverable for Task 5 Demand Forecast for the 2009 Water Comprehensive Plan (WCP) Update project.

This tech memo summarizes historical and projected demographics, summarizes historical water use characteristics, and provides a draft demand forecast. The tech memo is intended to allow the City to review the assumptions and results before this information is used to finalize the demand forecast and prepare the associated chapter.

This tech memo is structured in sections for ease of review. The sections are as follows:

 Section 1 Demand Forecast Methodology - describes the method used to develop the demand forecast

The subsequent sections provide tables and figures related to the following subjects:

- Section 2 Demographics
- Section 3 Production/Purchases and Peaking Factor
- Section 4 Sales, Customer Categories, Connections
- Section 5 Water Balance, Leakage, Non-Revenue Water
- Section 6 Water Use Factors and ERUs
- Section 7 Demand Forecast Results

1. Demand Forecast Methodology

The methodology used to develop the demand forecast is shown in Figure 1-1. The basic process is to combine demographic data with water use factors to develop the demand for retail sales. Demand components for non-revenue water, as well as for the Tulalip Tribes and Snohomish PUD, are then added in to create the total average day demand. To generate the total maximum day demand, a peaking factor is applied to all demands except the Tulalip and PUD

demands. This process is described in more detail below, using examples from tables throughout this technical memorandum.

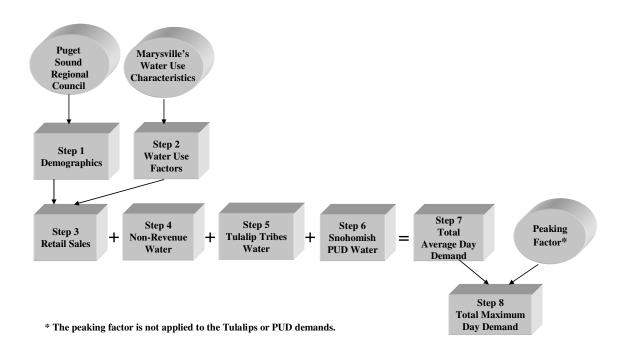

Figure 1-1 Demand Forecast Methodology

Step 1 Demographics

Demographic information is based on data obtained from the Puget Sound Regional Council or PSRC (October 2006 data set). The PRSC develops demographic projections for the four central Puget Sound Counties of King, Pierce, Snohomish, and Kitsap.

Below are the five demographic categories used by the PSRC, as well as information as to how they relate to the demand forecast:

- 1) **Population** Not used for the demand forecast, however data is presented to meet Washington State Department of Health water system planning requirements.
- 2) **Single Family Households** Key input to demand forecast.
- 3) Multifamily Households Key input to demand forecast.
- 4) **Employment** Key input to demand forecast.

The PSRC data provides projections for key milestone years. Those milestone years are 2000, 2010, 2020, 2030, and 2040. For the Marysville WCP analysis, the 20 year planning horizon concludes in Year 2028, so data was prepared through that year. Non-milestone years were interpolated using the milestone years.

The PSRC data is allocated to small geographic areas called Traffic Analysis Zones (TAZs). The TAZ boundaries are independent of the City's service area. Therefore, GIS analysis was used to determine which TAZs, or portions thereof, are in each of the City's water system pressure zones. The boundaries of the TAZs are overlayed on the pressure zones. Figure 2-1 demonstrates this. For any TAZ that is fully in a pressure zone, all of the demographics in that TAZ are assigned to that pressure zone. For any TAZ not fully in a pressure zone, a portion of the demographics in that TAZ are assigned to the pressure zone based on the percent of the TAZ in the pressure zone. For example, if 40% of the TAZ is in the pressure zone, then 40% of the demographics are assigned to the pressure zone.

The City is not currently serving every area within its Retail Service Area, however it plans to expand where it serves within its Retail Service area during the 20 year WCP planning period. Therefore, it is important that demographics are incorporated into the demand forecast at the appropriate time. Figure 2-2 shows when the City anticipates serving areas within its Retail Service Area.

Once the initial demographic projections were completed, the numbers were groundtruthed.

For single family, the estimated number of single family households was compared to the City's historical connection data. The number of single family households was less than the number of single family connections. The exact reason for this discrepancy is unknown, however the PSRC numbers are estimates while the City's connection data is a known quantity. Therefore, the demographics were adjusted to start with the number of 2006 single family connections and that number was increased over the planning period using PSRC's annual growth rate for single family households.

A similar groundtruthing for multifamily households was not feasible since multifamily connection data is for buildings rather than for households. However, the water use factor, analysis which divides actual multifamily sales by the initial estimate of the number of multifamily households, resulted in an unrealistically high multifamily water use factor. Since it is believed the sales numbers are correct, it is assumed the initial multifamily household projections were incorrect. Marysville staff believe the multifamily water use factor is approximately 85% of the single family household number. Therefore, the 2006 number of multifamily households from the initial analysis was increased so that the resulting mulifamily water use factor is 85% of the single family water use factor. Then the adjusted number of 2006 multifamily households was increased over the planning period using PSRC's multifamily annual growth rate.

The resulting demographics can be found in Tables 2-1 to 2-6. Below are a few of the key results:

- As shown in Table 2-3, the number of single family households is expected to increase from 18,880 in 2009 (WCP Year 1), to 20,897 in 2014 (WCP Year 6), to 29,212 in 2028 (WCP Year 20).
- As shown in Table 2-5, the number of multifamily households is expected to increase from 4,978 in 2009 (WCP Year 1), to 5,933 in 2014 (WCP Year 6), to 8,140 in 2028 (WCP Year 20).
- As shown in Table 2-6, the number of employees is expected to increase from 12,385 in 2009 (WCP Year 1) to 13,594 in 2014 (WCP Year 6), to 17,364 in 2028 (WCP Year 20).

Step 2 Water Use Factors

Water use factors are developed for the three key demographic units: 1) single family households, 2) multifamily households, and 3) employees. The water use factors are generated by analyzing Marysville's water use characteristics including production, sales, customer categories, and connections. As shown in Table 6-1, the water use factors are:

- 188 gallons per day (gpd) per single family household
- 160 gpd per multifamily household
- 90 gpd per employee

Two issues are important to understand about these water use factors.

First, as described above regarding the demographic projections, the multifamily water use factor was estimated by City staff to be 85% of the single family water use factor. An analysis dividing the actual multifamily sales by an initial estimate of the number of multifamily households resulted in an unrealistically high multifamily water use factor (248 gpd). Since it is believed the sales numbers are correct, it is assumed the initial multifamily household estimate was incorrect.

Second, water use in the non-residential sector is extremely variable due to the wide variety of businesses and institutions that make up this sector. The water use per employee number is an important and accurate input into the demand forecasting process. However, it is a system-wide average value. Actual water use per employee will vary substantially from one customer to another.

Step 3 Retail Sales Demand

The demographics projections (from Step 1) are multiplied by the water use factors (from Step 2) to generate the demand for the single family, multifamily, and non-residential sectors. For example, in 2009 the 18,880 single family households were multiplied by the water use factor of 188 gpd to result in 3,549,480 gpd demand for the single family sector.

Step 4 Non-Revenue Demand

The amount of retail non-revenue water expected must be projected. Since the water that Marysville wheels to the Tulalip Tribes and Snohomish PUD is technically considered non-revenue water, the term "retail non-revenue water" is used to represent the non-revenue water that is used in Marysville's retail service area (e.g., flushing water, leaks).

The retail non-revenue water is calculated by adding the demands projected thus far (from Steps 1-3) and multiplying by a retail non-revenue water factor. As shown in Table 5-2, the 2004-2006 average for retail non-revenue water as a percent of billed consumption was 9%. Therefore, 9% was used as the retail non-revenue water multiplying factor. For example, in 2009, the 464,155 gpd of retail non-revenue water was calculated by multiplying the total projected retail sales of 5,460,649 by 9%.

Steps 5 and 6 Tulalip Tribes and Snohomish PUD Demand

Marysville conveys Everett water through the City's pipes to the Tulalip Tribes and Snohomish PUD. The demand for the Tulalips and Snohomish PUD is based on their respective allocations from the Joint Operating Agreement (JOA) between the City, the PUD and the Tulalips.

The Tulalips demands were developed by increasing actual demands by twice the highest annual growth rate in recent years. The highest annual growth rate in Tulalips demands in recent years was 29%. Therefore, the 2006 actual Tulalips demands were increased by 58%. Each year thereafter was increased by 58%, until the Tulalips' full JOA allotment of 4,090,000 gpd was reached in 2012. The demands were then held constant for the remaining years. The City recognizes that the Tulalips demands may decrease once the pipeline being built to deliver water directly from Everett to the Tribes is complete. However, the City is planning conservatively for this WCP and thus includes demands for the Tulalips that reflect the JOA agreement.

The Snohomish PUD demands were developed by increasing actual demands by the most recent 3-year average annual growth rate. The 2004 to 2006 average annual growth rate in PUD demands was 18%. Therefore, the 2006 actual PUD demands were increased by 18%. Each subsequent year was then increased by 18%, until the PUD's full JOA allotment of 3,420,000 gpd was reached in 2019. The demands were then held constant for the remaining years.

Step 7 Total Average Day Demand (ADD)

The average day demand was calculated by adding the demands for single family, multifamily, non-residential, non-revenue water, the Tulalip Tribes and Snohomish PUD. For example, the 2009 average day demand is generated as follows:

```
3,549,480 gpd Single Family
796,549 gpd Multifamily
1,114,621 gpd Non-Residential
464,155 gpd Non-revenue Water
1,452,329 gpd Tulalip Tribes
+ 708,636 gpd Snohomish PUD
```

= 8,085,770 gpd Total Average Day Demand

As shown in Table 7-1, the total average day demand is expected to increase from 8,085,770 gpd in 2009 (WCP Year 1) to 12,343,539 gpd in 2014 (WCP Year 6), and to 16,577,328 gpd in 2028 (WCP Year 20).

Step 8 Total Maximum Day Demand (MDD)

To generate the total maximum day demand, a peaking factor is applied to all demands except the Tulalip and PUD demands. As shown in Table 3-2, the peaking factor is 1.7. For example, the 2009 maximum day demand is generated as follows:

```
5,924,804 gpd ADD Retail Demand (retail sales + retail non-revenue water)

x 1.7 peaking factor

= 10,072,167 gpd MDD Retail Demand (retail sales + retail non-revenue water)

1,452,329 gpd Tulalip Tribes

+ 708,636 gpd Snohomish PUD

= 12,233,133 gpd Total Maximum Day Demand
```

As shown in Table 7-1, the total maximum day demand is expected to increase from 12,233,133 gpd in 2009 (WCP Year 1) to 16,977,435 gpd in 2014 (WCP Year 6), and to 22,924,457 gpd in 2028 (WCP Year 20).

Step 9 Conservation Adjustment

The methodology outlined in Steps 1 through 8 creates a baseline demand forecast. This baseline forecast is then adjusted for conservation. (Note that the conservation adjustment step is not shown on Figure 1-1.)

The conservation adjustment was accomplished by reducing the water use factors in 2009-2014 to reflect the estimated conservation savings from the conservation program included in Chapter 4. The single family water use factor shifts from 188 gpd per single family household in 2008 to 184 gpd by 2014. The multifamily water use factor shifts from 160 gpd per multifamily household in 2008 to 156.6 gpd by 2014. The non-residential water use factor shifts from 90 gpd per employee in 2008 to 88.1 gpd by 2014.

Marysville plans to continue conservation efforts beyond 2014. However, since the conservation goals beyond 2014 are not defined at this time, the water use factors are then held constant for all years beyond 2014.

These water use factors, as well as the resulting demands, are shown in Table 7-2. With the conservation adjustment, the total average day demand is expected to increase from 8,020,898 gpd in 2009 (WCP Year 1) to 12,203,650 gpd in 2014 (WCP Year 6), and to 16,385,719 gpd in 2028 (WCP Year 20).

Table 7-2 is the only table in Section 7 that incorporates conservation. The rest of the tables show numbers without additional conservation. This is because the hydraulic modeling for the WCP uses the demands without additional conservation in order to error on the side of caution.

^{1.} For years 2006 to 2028, the demographics are based on data from the Puget Sound Regional Council or PSRC (October 2007 data set). The PSRC data uses four demographic categories: 1) population, 2) single family households, 3) multifamily households, and 4) employment.

^{2.} The North service area is served by the City's own wells.

^{3.} The South service area is served by water the City purchases from Everett.

^{4.} These demographics are associated with areas that are not currently in a pressure zone. They will be added to pressure zones as the City extends its infrastructure.

2028	20	7,366	502	42	6,511	141	1,337	2,687	651	2,060	2,889	24,184	1.5%

^{1.} For years 2006 to 2028, the demographics are based on data from the Puget Sound Regional Council or PSRC (October 2007 data set). The PSRC data uses four demographic categories: 1) population, 2) single family households, 3) multifamily households, and 4) employment.

- 2. The North service area is served by the City's own wells.
- 3. The South service area is served by water the City purchases from Everett.
- 4. These demographics are associated with areas that are not currently in a pressure zone. They will be added to pressure zones as the City extends its infrastructure.
- 5. The analysis of the PSRC data resulted in a number for single family households in Marysville's service area for 2006 that was 82% lower than the number of Marysville's single family connections in 2006. Therefore, the number of Maryville's 2006 connections were used as the number of 2006 single family connections and that number was increased over the planning period using PSRC's annual growth rate for single family households.

^{1.} For years 2006 to 2028, the demographics are based on data from the Puget Sound Regional Council or PSRC (October 2007 data set). The PSRC data uses four demographic categories: 1) population, 2) single family households, 3) multifamily households, and 4) employment.

- 2. The North service area is served by the City's own wells.
- 3. The South service area is served by water the City purchases from Everett.
- 4. These demographics are associated with areas that are not currently in a pressure zone. They will be added to pressure zones as the City extends its infrastructure.
- 5. The analysis of the PSRC data resulted in a number for single family households in Marysville's service area for 2006 that was 82% lower than the number of Marysville's single family connections in 2006. Therefore, the number of Maryville's 2006 connections were used as the number of 2006 single family connections and that number was increased over the planning period using PSRC's annual growth rate for single family households.

1. For years 2006 to 2028, the demographics are based on data from the Puget Sound Regional Council or PSRC (October 2007 data set). The PSRC data uses four demographic categories: 1) population, 2) single family households, 3) multifamily households, and 4) employment.

- 2. The North service area is served by the City's own wells.
- 3. The South service area is served by water the City purchases from Everett.
- 4. These demographics are associated with areas that are not currently in a pressure zone. They will be added to pressure zones as the City extends its infrastructure.
- 5. The analysis of the PSRC data resulted in a number for multifamily households in Marysville's service area that, when combined with the actual multifamily sales, resulted in an unrealistically high multifamily water use factor (248 gpd). Since it appears that the sales numbers are correct, it is assumed that the multifamily household numbers are incorrect. Marysville staff believe the multifamily water use factor is approximately 85% of the single family household number. Therefore, the 2006 number of multifamily households was increased so that the resulting mulifamily water use factor is 85% of the single family water use factor. Then the number of 2006 multifamily households was increased over the planning period using PSRC's multifamily annual growth rate.

Data Source: "Billed Revenue" by Year and "Consumption and Usage by Classification and Rate code" spreadsheets provided by City staff.

Five years of sales data was analyzed, however the average uses the most recent three years in order to focus on current trends.

The monthly distribution of actual water use may differ somewhat from this representation since billing numbers are based on meter read dates and many meters are read bi-monthly.

^{1.} Sales to customers within the City Limits.

^{2.} Sales to customers outside the City Limits.

^{3.} Wheeled water to Snohomish PUD and Tulalip Tribe.

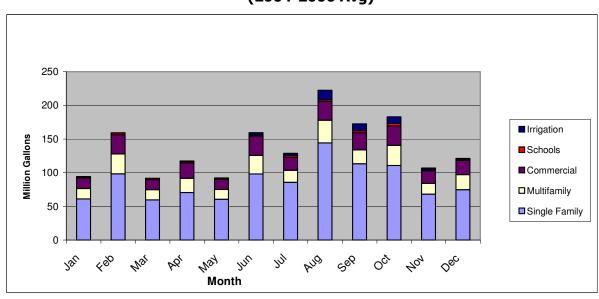

Figure 4-1 Water Billings Monthly Distribution – Retail Only (2004-2006 Avg)

The monthly distribution of actual water use may differ somewhat from this representation since billing numbers are based on meter read dates and many meters are read bi-monthly.

Data Source: "Billed Revenue" by Year and "Consumption and Usage by Classification and Rate code" spreadsheets provided by City staff.

		TOTAL		1,990 ⁶	100%

- 1. Marysville historically had an agreement to export water to the City of Arlington, however the Arlington Intertie was deactivated in 2005.
- 2. This is the water wheeled to the Tulalip Tribes and Snohomish PUD. Since this water is only wheeled through Marysville's pipes, but is not billed by Marysville, it is considered "unbilled metered consumption".
- 3. Data Source: "Consumption and Usage by Classification and Rate Code" spreadsheets provided by City staff.
- 4. Estimated use as follows: 9.3 mg high volume flushing.
- 5. Water Production minus all other categories.
- 6. From "Marysville Water Production" spreadsheet provided by City staff.

Table 5-2 Distribution System Leakage and "Retail" Non-Revenue Water (mg)

	Water		Authorized Consumpti	on			oution System Jeakage ⁴	"Retail" N	on-Revenue Water ⁵
Year	Produced/Purchased ¹		Unbilled C	onsumption	1		Percent of		Percent of Billed
	Troduced/Turchased	Billed Consumption ²	PUD and Tulalip Wheeled Water	Other ³	Total	Qty	Production Production	Qty	Consumption
2003	2,059	1,697	198	10	208	153	7%	163	9.6%
2004	2,245	1,680	261	10	272	293	13%	303	18.0%
2005	1,863	1,546	246	9	255	63	3%	71	4.6%
2006	1,990	1,651	291	9	300	39	2%	48	2.9%
2004-2006 Average ⁶	2,033	1,626	266	9	276	131	6.1%	141	9%

- 1. Data Source: "Marysville Water Production" spreadsheet provided by City staff.
- 2. Data Source: "Consumption and Usage by Classification and Rate Code" spreadsheets provided by City staff.
- 3. This category represents any unbilled authorized consumption aside from the wheeled water such as flushing, firefighting, etc. For 2006, City staff documented flushing usage ("2006 High Volume Flushing") at 9.3 mg. Flushing water was estimated for the other year using the 2006 ratio of flushing water to water production/purchases.
- 4. Distribution system leakage is defined in the new Water Use Efficiency Rule as water production and purchases minus authorized consumption.
- 5. This represents the non-revenue water that is used in the retail service area. The calculation is the water production and purchases minus the billed consumption and the PUD and Tulalip wheeled water. These numbers are used to develop the retail non-revenue portion of the demand forecast.
- 6. Data is presented for four years to show a lengthy history; however the average uses the most recent three years to focus on current trends.

6. Water Use Factors and ERUs

Table 6-1 Water Use Factors and ERUs (2004-2006 Avg)

Customer Category	Sales (gpd) ²	Households or Employees		Sales Per Household on Employee (gpd)	r	Number of ERUs
Single Family	2,864,212	15,241	3	188		15,241
Multifamily	724,208	4,526	4	160	6	3,852
Non-Residential ¹	929,038	10,378	5	90		4,942

- 1. This includes the following customer categories: commercial, schools, and irrigation.
- 2. Data Source: "Billed Revenue" by Year and "Consumption and Usage by Classification and Rate code" spreadsheets provided by City staff.
- 3. Assumed to be the same as the number as single family connections.
- 4. This number is the result of the actual multifamily sales divided by the estimated multifamily water use factor. See footnote #6 for more information.
- 5. Based on data in the demographics analysis. For 2006 10,482 employees were estimated. Back-calculated the number of employees for 2004 and 2005 (using 1.0% annual growth rates). Then calculated a 2004-2006 average.
- 6. Estimated to be 85% of the single family water use factor. An analysis dividing the actual multifamily sales by an initial estimate of the number of multifamily households (MF HH) resulted in an unrealistically high multifamily water use factor (248 gpd). Since it is believed the sales numbers are correct, it is assumed the initial MF HH estimate was incorrect. New MF HH estimates were developed based on the estimated multifamily water use factor.

1. From the	demog	aphics tables.															

^{2.} From the water use factors table.

^{3.} The number of single family households multiplied by the water use per single family household.

^{4.} The number of multifamily households multiplied by the water use per multifamily household.

^{5.} The number of employees multiplied by the water use per employee.

^{6.} The sum of the SF, MF, and Non-Residential demands.

^{7.} The sum of the SF, MF, and Non-Residential demands multiplied by the percent of "retail non-revenue water" as a percent of sales. (Note this is intentionally different than non-revenue as a percent of production.) Also note that actual nonrevenue water decreased significantly between 2004 and 2005, which according to Marysville staff was due to fixing a large leak under the slough.

^{8.} The sum of the SF, MF, and Non-Residential demands plus the non-revenue water.

^{9.} The Tulalip Tribes demands were developed by increasing actual demands by twice the highest annual growth rate in recent years. The highest annual growth rate in recent years was 29%. Therefore, the 2006 actual demands were increased by 58%. Each subsequent year was then increased by 58%, until the Tribes full JOA allotment of 4,090,000 gpd was reached in 2012. The demands were then held constant for the remaining years.

^{10.} The PUD demands were developed by increasing actual demands by the most recent 3-year average annual growth rate. The 2004 to 2006 average annual growth rate was 18%. Therefore, the 2006 actual demands were increased by 18%. Each subsequent year was then increased by 18%, until the PUD's full JOA allotment of 3,420,000 gpd was reached in 2019. The demands were then held constant for the remaining years.

^{11.} The sum of the retail subtotal, plus the Tulalip Tribes and Snohomish PUD water.

^{12.} A peaking factor of 1.7 (which is the 2004-2006 average peaking factor) is applied to the retail portion of the average day demand. For 2003-2006, the actual peak day production number is used.

^{13.} Numbers for 2003-2006 are actuals.

^{1.} From the demographics tables.

^{2.} For 2007-2008, from the water use factor table. For 2009-2014, the water use factor are reduced to match the estimated savings from Marysville's 2009-2014 conservation program. For 2015-2028, held constant since conservation savings beyond 2014 have not be identified.

^{3.} The number of single family households multiplied by the water use per single family household.

^{4.} The number of multifamily households multiplied by the water use per multifamily household.

^{5.} The number of employees multiplied by the water use per employee.

^{6.} The sum of the SF, MF, and Non-Residential demands.

^{7.} The sum of the SF, MF, and Non-Residential demands multiplied by the percent of "retail non-revenue water" as a percent of sales. (Note this is intentionally different than non-revenue as a percent of production.) Also note that actual non-revenue wat

^{8.} The sum of the SF, MF, and Non-Residential demands plus the non-revenue water.

^{9.} The Tulalip Tribes demands were developed by increasing actual demands by twice the highest annual growth rate in recent years. The highest annual growth rate in recent years was 29%. Therefore, the 2006 actual demands were increased by 58%. Each subsequent year was then increased by 58%, until the Tribes full JOA allotment of 4,090,000 gpd was reached in 2012. The demands were then held constant for the remaining years.

10. The PUD demands were developed by increasing actual demands by the most recent 3-year average annual growth rate. The 2004 to 2006 average annual growth rate was 18%. Therefore, the 2006 actual demands were increased by 18%.

^{10.} The PUD demands were developed by increasing actual demands by the most recent 3-year average annual growth rate. The 2004 to 2006 average annual growth rate was 18%. Therefore, the 2006 actual demands were increased by 18% Each subsequent year was then increased by 18%, until the PUD's full JOA allotment of 3,420,000 gpd was reached in 2019. The demands were then held constant for the remaining years.

^{11.} The sum of the retail subtotal, plus the Tulalip Tribes and Snohomish PUD water.

^{12.} A peaking factor of 1.7 (which is the 2004-2006 average peaking factor) is applied to the retail portion of the average day demand. For 2003-2006, the actual peak day production number is used.

^{13.} Numbers for 2003-2006 are actuals.

^{1.} From the demographics tables.

^{2.} From the water use factor table.

^{3.} The number of single family households multiplied by the water use per single family household.

^{4.} The number of multifamily households multiplied by the water use per multifamily household.

^{5.} The number of employees multiplied by the water use per employee.

^{6.} The sum of the SF, MF, and Non-Residential demands.

^{7.} The sum of the SF, MF, and Non-Residential demands multiplied by the percent of "retail non-revenue water" as a percent of sales. (Note this is intentionally different than non-revenue as a percent of production.)

^{8.} The sum of the SF, MF, and Non-Residential demands plus the non-revenue water.

^{9.} The total average day demand multiplied by a peaking factor of 1.7 which is the 2004-2006 average peaking factor. For 2006, the actual peak day production number is used.

^{1.} From the demographics tables.

^{2.} From the water use factor table.

^{3.} The number of single family households multiplied by the water use per single family household.

^{4.} The number of multifamily households multiplied by the water use per multifamily household.

^{5.} The number of employees multiplied by the water use per employee.

^{6.} The sum of the SF, MF, and Non-Residential demands.

^{7.} The sum of the SF, MF, and Non-Residential demands multiplied by the percent of "retail non-revenue water" as a percent of sales. (Note this is intentionally different than non-revenue as a percent of production.)

^{8.} The sum of the SF, MF, and Non-Residential demands plus the non-revenue water.

^{9.} The total average day demand multiplied by a peaking factor of 1.7 which is the 2004-2006 average peaking factor. For 2006, the actual peak day production number is used.

^{1.} From the demographics tables.

^{2.} From the water use factor table.

^{3.} The number of single family households multiplied by the water use per single family household.

^{4.} The number of multifamily households multiplied by the water use per multifamily household.

^{5.} The number of employees multiplied by the water use per employee.

^{6.} The sum of the SF, MF, and Non-Residential demands.

^{7.} The sum of the SF, MF, and Non-Residential demands multiplied by the percent of "retail non-revenue water" as a percent of sales. (Note this is intentionally different than non-revenue as a percent of production.)

^{8.} The sum of the SF, MF, and Non-Residential demands plus the non-revenue water.

^{9.} The total average day demand multiplied by a peaking factor of 1.7 which is the 2004-2006 average peaking factor. For 2006, the actual peak day production number is used.

^{1.} From the demographics tables.

^{2.} From the water use factor table.

^{3.} The number of single family households multiplied by the water use per single family household.

^{4.} The number of multifamily households multiplied by the water use per multifamily household.

^{5.} The number of employees multiplied by the water use per employee.

^{6.} The sum of the SF, MF, and Non-Residential demands.

^{7.} The sum of the SF, MF, and Non-Residential demands multiplied by the percent of "retail non-revenue water" as a percent of sales. (Note this is intentionally different than non-revenue as a percent of production.)

^{8.} The sum of the SF, MF, and Non-Residential demands plus the non-revenue water.

^{9.} The total average day demand multiplied by a peaking factor of 1.7 which is the 2004-2006 average peaking factor. For 2006, the actual peak day production number is used.
